

Map showing the difference between wind speed at approximately hub height for scenario 20A3 and the reference simulation for 15:00 GMT on 26 October 2006

Figure 16

An example where the winds are from the southwest. The colour scale gives the wind speed difference in m/s. The lower wind speeds in the wind farms and surrounding areas mainly downwind of the wind farms and wind farm clusters, can be seen. Higher winds than those in the reference simulation can also be seen.
